**Question:** Let  $X$  represent the difference between the number of heads and the number of tails obtained when a coin is tossed 6 times. What are the possible values of  $X$ ? Also find the Probability distribution of  $X$ .

**Solution:**

It is given that the coin is tossed 6 times.

Let  $H$  be a random variable which denotes the number of heads,

$$H = \{0, 1, 2, 3, 4, 5, 6\} \quad (1)$$

Let  $T$  be a random variable which denotes the number of tails,

$$T = 6 - H \quad (2)$$

$$= \{6, 5, 4, 3, 2, 1, 0\} \quad (3)$$

Let  $X$  be a random variable which denotes the absolute value of the difference between the number of heads and number of tails,

$$X = |H - T| \quad (4)$$

$$= |H - (6 - H)| \quad (5)$$

$$= |2H - 6| \quad (6)$$

Therefore,  $X$  can take values from the set  $\{0, 2, 4, 6\}$ .

Now we will find the probability distribution of  $X$  using the CDF approach,

The CDF of  $H$  is given by:

$$F_H(k) = \Pr(H \leq k) \quad (7)$$

$$= \sum_{i=0}^k \Pr(H = i) \quad (8)$$

$$= \sum_{i=0}^k \frac{{}^6C_i}{2^6} \quad (9)$$

First we will do the analysis for  $k = 2, 4$  and  $6$

So the CDF of  $X$  will be:

$$F_X(k) = \Pr(X \leq k) \quad (10)$$

$$= \Pr(|2H - 6| \leq k) \quad (11)$$

$$= \Pr(-k \leq 2H - 6 \leq k) \quad (12)$$

$$= \Pr\left(\frac{6-k}{2} \leq H \leq \frac{6+k}{2}\right) \quad (13)$$

$$= F_H\left(3 + \frac{k}{2}\right) - F_H\left(3 - \frac{k}{2} - 1\right) \quad (14)$$

$$= F_H\left(3 + \frac{k}{2}\right) - F_H\left(2 - \frac{k}{2}\right) \quad (15)$$

So the probability distribution of X would be given by:

$$p_X(k) = F_X(k) - F_X(k-1) \quad (16)$$

$$= F_H\left(3 + \frac{k}{2}\right) - F_H\left(2 - \frac{k}{2}\right) - F_H\left(2.5 + \frac{k}{2}\right) + F_H\left(3.5 - \frac{k}{2}\right) \quad (17)$$

$$= \left( \sum_{i=0}^{3+\frac{k}{2}} \frac{{}^6C_i}{2^6} - \sum_{i=0}^{2.5+\frac{k}{2}} \frac{{}^6C_i}{2^6} \right) + \left( \sum_{i=0}^{3.5-\frac{k}{2}} \frac{{}^6C_i}{2^6} - \sum_{i=0}^{2-\frac{k}{2}} \frac{{}^6C_i}{2^6} \right) \quad (18)$$

$$= \frac{{}^6C_k}{2^6} + \frac{{}^6C_{6-k}}{2^6} \quad (19)$$

$$= \frac{{}^6C_k}{2^5} \quad (k = 2, 4, 6) \quad (20)$$

Now we will do the analysis for  $k = 0$ ,  
CDF of X for will be

$$F_X(k) = F_H\left(\left[3 + \frac{k}{2}\right]\right) - F_H\left(\left[3 - \frac{k}{2}\right]\right) \quad (21)$$

So the probability distribution of X would be given by:

$$p_X(k) = F_X(k) - F_X(k-1) \quad (22)$$

$$= F_H\left(\left[3 + \frac{k}{2}\right]\right) - F_H\left(\left[3 - \frac{k}{2}\right]\right) - F_H\left(\left[2.5 + \frac{k}{2}\right]\right) + F_H\left(\left[3.5 - \frac{k}{2}\right]\right) \quad (23)$$

$$= F_H\left(3 + \left[\frac{k}{2}\right]\right) - F_H\left(3 - \left[\frac{k}{2}\right]\right) - F_H\left(2 + \left[\frac{k}{2}\right]\right) + F_H\left(3 - \left[\frac{k}{2}\right]\right) \quad (24)$$

$$= F_H\left(3 + \left[\frac{k}{2}\right]\right) - F_H\left(2 + \left[\frac{k}{2}\right]\right) \quad (25)$$

$$= \sum_{i=0}^{3+\left[\frac{k}{2}\right]} \frac{{}^6C_i}{2^6} - \sum_{i=0}^{2+\left[\frac{k}{2}\right]} \frac{{}^6C_i}{2^6} \quad (k = 0) \quad (26)$$

The plot of probability distribution of X is shown below:
